

Communication

Date	15 July 2026
Project Name	Rising Waters: A Machine Learning Approach to Flood Prediction
Maximum Marks	1 Mark

This document outlines the communication strategy used throughout the Rising Waters project lifecycle. As a solo project, communication centered on structured mentor check-ins rather than internal team coordination.

S . N o	Communication Type	Frequency	Channel / Tool	Participants	Purpose
1	Personal Task Tracking	Daily	Personal notes / task tracker	Nanda Gunasri	Track daily progress on model training, Flask routes, and UI build
2	Progress Update	Weekly	WhatsApp / Email	Nanda Gunasri, Adnan Saif (Trainer)	Share weekly progress against the sprint backlog and get feedback
3	Issue / Bug Discussion	As Needed	Direct message / mentor office hours	Nanda Gunasri, Adnan Saif (Trainer)	Resolve blockers quickly (e.g. model accuracy, validation edge cases)
4	Stakeholder Review	Bi-Weekly	Video call / screen share	Nanda Gunasri, Adnan Saif (Trainer)	Demo working increments and gather feedback on UI/UX and model behavior
5	Final Demo Rehearsal	Once	Video call	Nanda Gunasri, Adnan Saif (Trainer)	Walk through the live deployed app before final submission
6	Commit Log / Version History	Continuous	GitHub (https://github.com/NandaGunasri/Rising-Waters)	Nanda Gunasri	Maintain a running record of development history and changes

Communication Challenges & Resolutions

S. No	Challenge Faced	Resolution / Action Taken
1	Working solo meant no immediate peer feedback on design or UX decisions.	Relied on scheduled mentor review sessions and iterative self-testing with sample rainfall inputs to validate decisions.
2	Coordinating mentor feedback around a tight submission timeline.	Batched questions into scheduled bi-weekly reviews instead of ad hoc messages, to respect the mentor's time and get more thorough answers.

S. No	Challenge Faced	Resolution / Action Taken
3	Explaining technical ML details (model choice, validation bounds) in reviews without losing non-technical context.	Prepared plain-language summaries for check-ins and let the UI's own gauges and result pages make outcomes self-explanatory.
